1. **(12 points)**

Consider the system of equations

\[
\begin{align*}
    x_1 + 3x_2 - 5x_3 &= 4 \\
    x_1 + 4x_2 - 8x_3 &= 7 \\
    -3x_1 - 7x_2 + 9x_3 &= -6.
\end{align*}
\]

Find the general solution to these equations in parametric form. What geometric shape does the solution space form?
2. (12 points)

Are the vectors

\[ \mathbf{v}_1 = \begin{pmatrix} 1 \\ 0 \\ -1 \end{pmatrix}, \mathbf{v}_2 = \begin{pmatrix} 1 \\ 2 \\ 3 \end{pmatrix}, \mathbf{v}_3 = \begin{pmatrix} -1 \\ 3 \\ -1 \end{pmatrix}, \]

linearly independent?

(b) Give an example of 4 vectors in \( \mathbb{R}^3 \) that are linearly independent or explain (algebraically) why such an example does not exist.
3. (18 points)

(a) Define what it means for $T: \mathbb{R}^n \rightarrow \mathbb{R}^m$ to be a linear transformation.

(b) Let $T: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ be defined by $T(x_1, x_2) = (x_1 + x_2, x_1)$. Determine the matrix associated to $T$. 
(c) Let $T : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ be the linear transformation defined by first rotating by $\pi/2$ radians counterclockwise and then reflecting over the $x$-axis. Determine the matrix associated to $T$. 
4. **(12 points)**

Is \( b \) in the span of the columns of \( A \) where

\[
A = \begin{pmatrix}
1 & 0 & 2 \\
0 & 3 & 1 \\
0 & 0 & 4 \\
0 & 0 & 0
\end{pmatrix}
\quad \text{and} \quad
b = \begin{pmatrix}
1 \\
2 \\
3 \\
? 
\end{pmatrix}
\]

Explain your answer.
(b) How many solutions (if any) does the equation $A\mathbf{x} = \mathbf{b}$ have where

$$A = \begin{pmatrix} 1 & 0 & 1 & 0 \\ 0 & 1 & 2 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix} \quad \text{and} \quad \mathbf{b} = \begin{pmatrix} -1 \\ 3 \\ 7 \end{pmatrix}?$$

Explain your answer.
5. (18 points)

(a) Does there exist a map from $\mathbf{R}^4$ to $\mathbf{R}^7$ that is both one-to-one and onto? If yes, give an example. If no, explain why not.

(b) Does there exist a map from $\mathbf{R}^3$ to $\mathbf{R}^2$ that is onto, but not one-to-one? If yes, give an example. If no, explain why not.
(c) Does there exist a map from $\mathbb{R}^4$ to $\mathbb{R}^4$ that is one-to-one, but not onto? If yes, give an example. If no, explain why not.
6. **(12 points)**
Consider the matrices

\[
A = \begin{pmatrix} 1 & 2 \\ 3 & 0 \end{pmatrix} \quad \text{and} \quad B = \begin{pmatrix} 1 & 0 \\ 0 & 3 \\ -2 & 1 \end{pmatrix}.
\]

Only one of the products \(AB\) and \(BA\) makes sense. Determine which one and compute that product.
7. (32 points) Circle either TRUE or FALSE. No justification is needed. Correct answers score 4 points each. Incorrect answers score 0 points. Leaving a question blank scores 2 points.

(a) Every matrix is row equivalent to a unique matrix in echelon form.

TRUE
FALSE

(b) It is possible for the equation $A\mathbf{x} = \mathbf{b}$ to have no solutions while at the same time for the equation $A\mathbf{x} = \mathbf{0}$ to have infinitely many solutions.

TRUE
FALSE

(c) If the columns of a 5 by 4 matrix are linear independent then the columns span $\mathbb{R}^5$.

TRUE
FALSE

(d) If $n < m$ and $T : \mathbb{R}^n \rightarrow \mathbb{R}^m$ is a linear transformation, then $T$ is one-to-one.

TRUE
FALSE

(e) If $\mathbf{b}$ is in the span of the columns of $A$, then the matrix equation $A\mathbf{x} = \mathbf{b}$ has at least one solution.

TRUE
FALSE

(f) If $A$ is matrix with a pivot point in every row and $B$ is a matrix with a pivot point in every row, then the product $AB$ will have a pivot point in every row.

TRUE
FALSE

(g) If $A$ contains a row of all zeroes, then the equation $A\mathbf{x} = \mathbf{0}$ has no solutions.

TRUE
FALSE

(h) A homogenous system of three equations with seven unknowns will always have infinitely many solutions.

TRUE
FALSE
